Level 2 → Level 3: Handling Filenames with Spaces

Objective: Read a file whose name contains spaces.

Command used:
cat "spaces in this filename"

Procedure:

1. Logged in using the bandit2 account.
2. Listed the files in the current directory.
3. Identified the filename containing multiple spaces.
4. Enclosed the filename in quotation marks and used cat to display its contents.
5. Saved the resulting password for the next level.

Result: Successfully accessed a file with spaces in its name and retrieved the next password.

Concept learned: Filenames containing spaces must be handled carefully in the shell. Quotation marks allow the shell to interpret the filename as a single argument.
