Level 8 → Level 9: Finding a Unique Line

Objective: Identify the line that appears only once in data.txt.

Command used:
sort data.txt | uniq -u

Procedure:

1. Logged in using the bandit8 account.
2. Inspected the data.txt file.
3. Used sort to arrange the lines in order.
4. Piped the sorted output into uniq -u.
5. Recorded the line that appeared only once.

Result: Identified the unique line containing the next password.

Concept learned: The uniq command detects repeated adjacent lines. Sorting the input first ensures that identical lines are grouped together. The -u option displays lines that occur only once.
