TryHackMe Writeup: Learning Cyber Security

- **Platform:** TryHackMe
- **Room:** https://tryhackme.com/room/beginnerpathintro
- **Topics:** Web application security, network security, cybersecurity learning paths

1. Objective

This introductory room presents three areas of cybersecurity learning: web application security, network security, and learning roadmaps for progressing into cybersecurity.

2. Task and Method

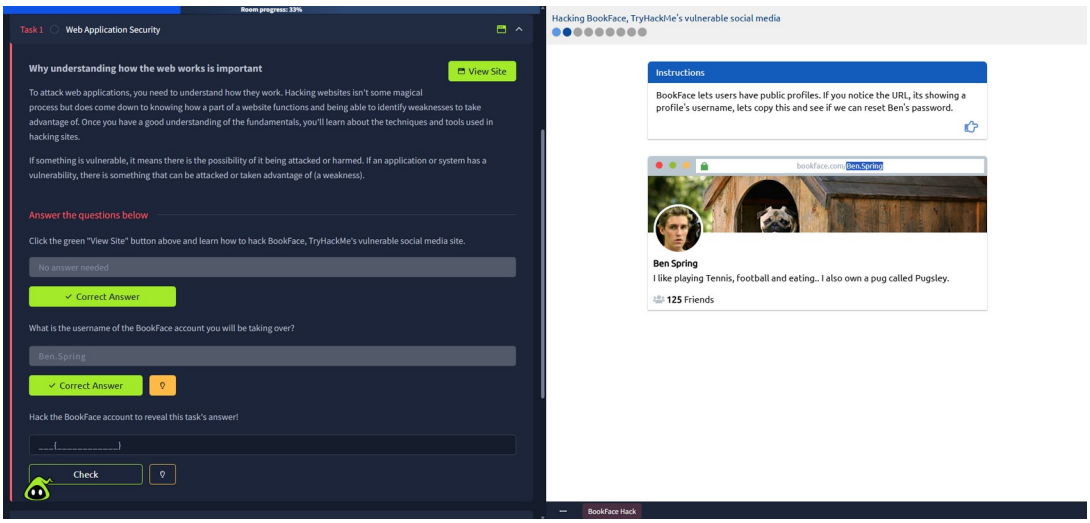

Task 1 - Web Application Security

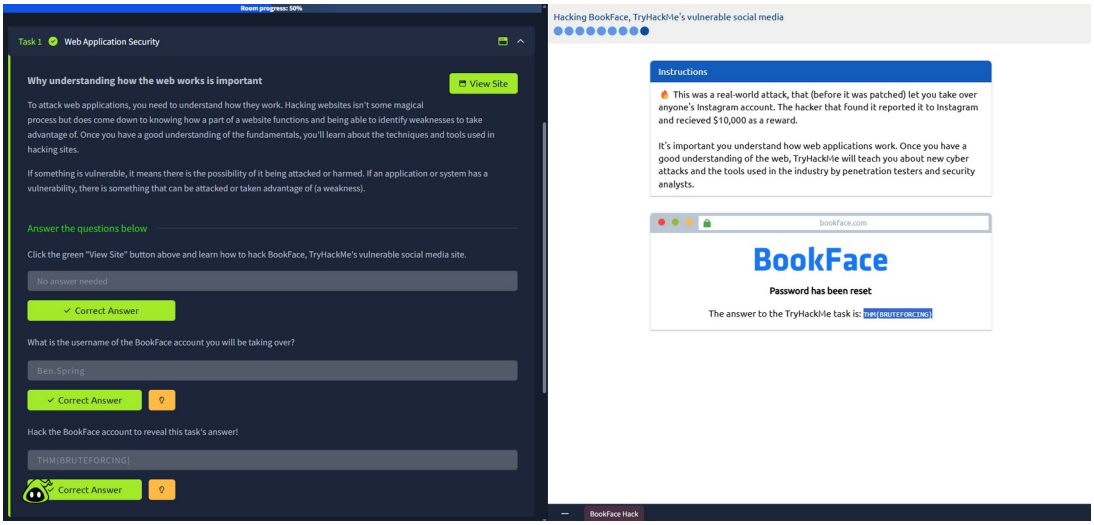

What I learned

Web applications contain components, authentication mechanisms, and data flows. Understanding them helps learners identify potential weaknesses. A vulnerability is a weakness that could be exploited to affect a system or its data.

Practical steps

1. Open the room and choose **View Site** for the BookFace exercise.
2. Read the training site's instructions and inspect its login flow.
3. Follow only the actions provided by the TryHackMe exercise.
4. Submit the requested answers in the room and capture evidence of completion.

Answers to verify

- **BookFace account username:** Ben.Spring
- **Flag revealed by the exercise:** THM{BRUTEFORCING}

These answers are reported in a walkthrough published on 9 September 2025. Verify them against the live room before submission, since lab content can change.

Security lesson

Weak authentication controls can allow account takeover. Defenses include strong unique passwords, multi-factor authentication, rate limiting, monitoring repeated failed logins, and reducing account-enumeration weaknesses.

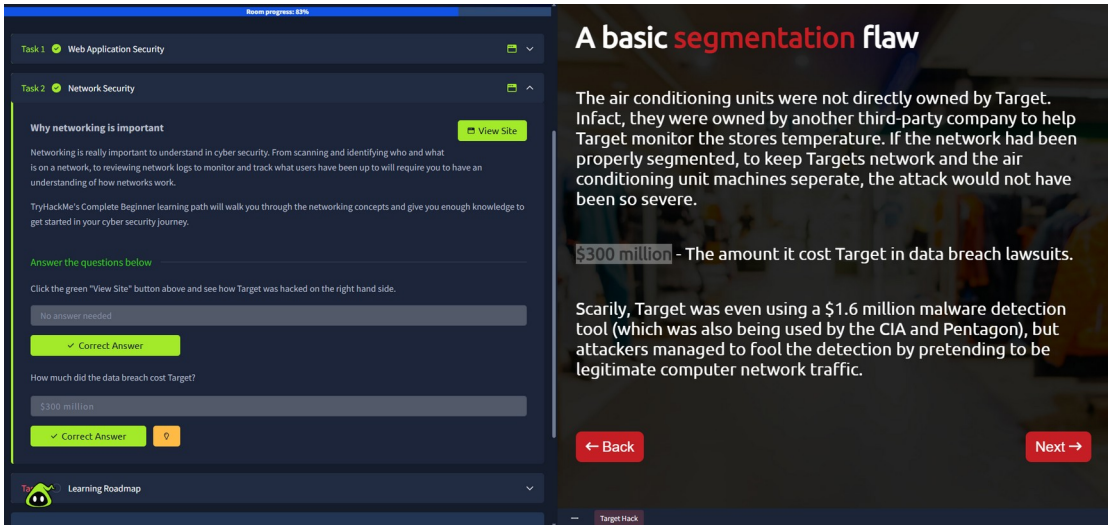

Task 2 - Network Security

What I learned

Networking knowledge helps security professionals understand how devices communicate, identify exposed services, review network logs, and investigate suspicious activity.

Practical steps

1. Choose **View Site** for the Target data-breach example.
2. Read the incident summary displayed in the exercise.
3. Find the reported breach cost and submit it to the room.
4. Capture evidence of completion.

Answer to verify

- **Reported cost of the Target data breach:** $300 million

This answer appears in a walkthrough published on 9 September 2025. Confirm the exact expected answer in the live room before submitting.

Security lesson

Network segmentation, secure configuration, timely patching, access control, monitoring, and incident-response planning can reduce the likelihood and impact of security incidents.

Task 3 - Learning Roadmap

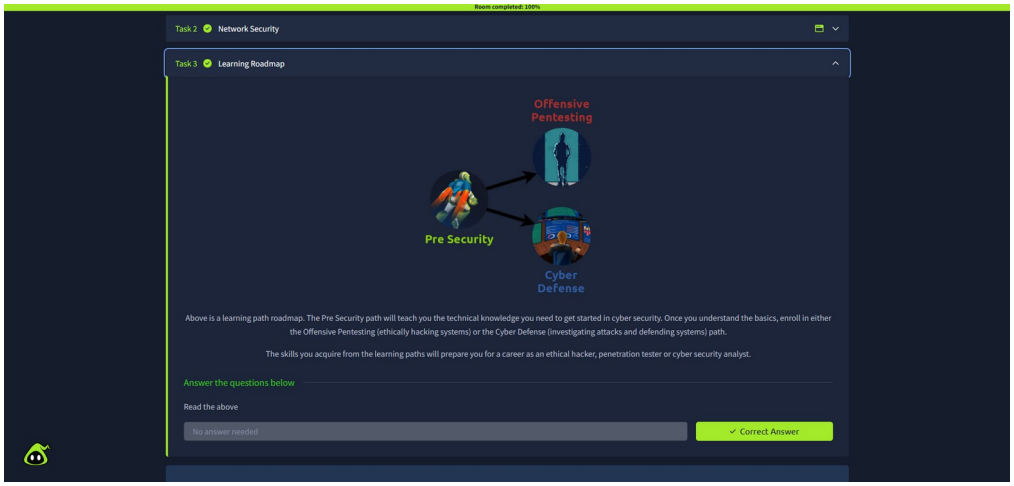

What I learned

The room recommends building foundational knowledge before choosing a specialty.

- **Pre Security:** Builds technical foundations needed to start learning cybersecurity.
- **Offensive Pentesting:** Focuses on authorized security testing and identifying weaknesses.
- **Cyber Defense:** Focuses on defending systems and investigating attacks.
- Possible career directions include ethical hacking, penetration testing, and cybersecurity analysis.

Practical steps

1. Read the learning-roadmap section and review the displayed path.
2. Understand the difference between offensive testing and defensive security.
3. Complete the task in TryHackMe and capture evidence.

Answer: The public room page instructs learners to read the roadmap; it does not show a separate text question for this task.

3. Answer Summary

Task	Question / activity	Answer or completion note
1	Username of the BookFace account	Ben.Spring
1	Flag revealed by the exercise	THM{BRUTEFORCING}
2	Reported cost of Target data breach	$300 million
3	Learning roadmap	Review Pre Security, Offensive Pentesting, and Cyber Defense paths

Verification note: The official room requires login for interactive material. Answers above are cross-referenced with a third-party walkthrough and should be checked during your own room session.

4. Key Concepts Learned

- Web application vulnerabilities arise when components or controls do not behave securely.
- Authentication verifies identity; authorization determines what an identity can access.
- Weak login protections increase the risk of account takeover.
- Networking fundamentals support attack investigation and defensive monitoring.
- A structured roadmap helps learners build fundamentals before choosing a specialty.
- Offensive testing must remain within an explicitly authorized environment and scope.

Great work kunaljain17905! Room completed!
